

Forest Restoration Processes

When a tree falls over in a forest in good condition, natural regeneration can occur quickly.

- (A) Fruiting trees nearby rain seed (B)
- (C) Animals living in the forest disperse seeds
- (D) Damaged trees and (E) tree stumps regrow
- (F) seedlings and (G) saplings now have light to grow quickly
- (H) Seeds in the soil seed bank germinate

When humans clear forest, most of these natural processes stop working

Colour in the regenerating forest!
